Secproof Finland claims: data leakage in Finland was preventable

Secproof has launched the first comprehensive solution for preventing data leaks. Secproof's system is aimed primarily for companies producing cloud services as well as to function as a part of data centers' infrastructure. Hospitals and other organizations dealing with a lot of critical information will benefit from this solution called simply: *Secproof*.

The company Secproof specializes in information security, Identity Management and assuring business continuity.

The solution employs strong encryption. It prevents data leaks from databases, file systems and computer programs. Even the administrators are unable to tamper with the encryption and every single action is retraceable.

"The data leaks that just took place in Finland could have most certainly been prevented with *Secproof*", Secproof Finland's CEO Matti Hämäläinen states.

"The key to stopping data leaks is to choose the appropriate controls. In practice, forming the big picture means companies must go through the whole scale, from administrative security all the way to defining the encryption. *Secproof* enhances this process significantly. All systems should always be designed with the overall information security in mind", Hämäläinen says.

Strong technology collaborating

Secproof Finland's Sales Manager Ismo Sillanpää says that Secproof has found a strong partner in American Vormetric.

"Vormetric's technology is unbeatable in functionality and scalability. Naturally, this fits our critical clientele in Finland and elsewhere in Europe."

CEO Matti Hämäläinen wants to remind everybody that data leaks do not have to happen anymore.

"The solution exists – people just have to use it! There is no reason that data should leak outside of the set boundaries anymore."
